Hypoglycemia (low blood glucose) happens when blood glucose drops below optimal levels. A blood glucose of 70 mg/dl or less is considered hypoglycemia.

Hypoglycemia usually occurs in people who take insulin or certain diabetes pills; although, it can happen to anyone with diabetes.

Hypoglycemia may result from one or more of the following:
- Taking too much diabetes medication
- Delaying or skipping a meal
- Not eating enough carbohydrate at your meal
- Exercising harder or more than usual
- Drinking alcohol without food

Symptoms of hypoglycemia
Symptoms can vary from person to person and based on how low the blood glucose is.

<table>
<thead>
<tr>
<th>Mild hypoglycemia</th>
<th>Severe hypoglycemia</th>
</tr>

</table>

Take note of how often you experience symptoms of hypoglycemia, and test your blood glucose more often for the next day or two. If you experience hypoglycemia several times per week, discuss your treatment plan with your health care provider or a registered dietitian.
Follow the Rule of 15 —
to treat hypoglycemia

**Step 1)** Check your blood glucose. If it is below 70 mg/dl, eat or drink **15 grams** of carbohydrate. Examples include:
- 3–4 glucose tablets
- 15-gram tube of glucose gel or liquid
- 1/2 cup fruit juice
- 1/2 cup regular soda

If you cannot check your blood glucose right away, eat or drink 15 grams of carbohydrate just to be safe.

**Step 2)** Wait **15 minutes** — this is important! It takes 15 minutes to feel better, no matter how much carbohydrate you use to treat the low blood glucose.

**Step 3)** Check your blood glucose again. If your blood glucose level is still low (<70 mg/dl), or if you still have symptoms, repeat steps 1 through 3.

If you still have a low blood glucose after three checks, call 911.

**Step 4)** Check your blood glucose one hour after treatment, as additional carbohydrate may be needed if you don’t have a meal or snack planned. (Blood glucose levels tend to drop about one hour after treatment).

**Prevention**
To help prevent hypoglycemia, ask yourself the following questions:
- Can my diabetes medications cause hypoglycemia? Have my diabetes medications changed?
- Has my meal plan changed? Am I eating regular meals and snacks?
- Have I been more active than usual?
- Did I drink alcoholic beverages on an empty stomach?

Work with your diabetes care team to understand when your diabetes medications peak, if your medication schedule matches your meal plan and activity, and how to treat hypoglycemia when it occurs. The amount of carbohydrate needed may vary with age and activity.
